What is claimed is:

5

25

1. An electronic circuit apparatus, wherein a plurality of unit circuit devices each having an electronic circuit are mounted adjacent to each other on a substrate and said unit circuit devices are mutually electrically connected, wherein

terminals arranged on a side adjacent to said other unit circuit devices and respectively connected to said electronic circuit by inter-connection not via said input/output interface circuit; and

a plurality of external connection

terminals arranged on a side not adjacent to said other unit circuit devices and respectively connected to said electronic circuit by inter-connection via said input/output interface circuit.

20 2. An electronic circuit apparatus as set forth in claim 1, wherein

said unit circuit device comprises a plurality of test terminals for a test on said electronic circuit arranged on a side not adjacent to said other unit circuit devices; and

said test terminals are connected respectively to said electronic circuit by inter-connection via said input/output interface circuit.

5 3. An electronic circuit apparatus as set forth in claim 1, wherein

said unit circuit device has a plurality of test terminals for a test on said electronic circuit arranged on a side adjacent to said other unit circuit devices and inside said device connection terminals; and

said test terminals are connected respectively to said electronic circuit by inter-connection via said input/output interface circuit.

10

20

25

4. An electronic circuit apparatus as set forth in claim 1, wherein

said external connection terminals serve as connection terminals for connecting with outside the electronic circuit apparatus and also as connection terminals for a test on said electronic circuit.

5. An integrated circuit device comprising an electronic circuit, a plurality of which are mounted adjacent to each other in one module and said electronic circuits are electrically connected, comprising:

an input/output interface circuit;

a plurality of device connection terminals arranged on a side adjacent to other integrated circuit devices when mounted on a module and respectively

- 5 connected to said electronic circuit by inter-connection not via said input/output interface circuit; and
- a plurality of external connection terminals arranged on a side not adjacent to said other integrated circuit devices and respectively connected to said

  10 electronic circuit by inter-connection via said input/output interface circuit.
  - 6. An integrated circuit device as set forth in claim 5, wherein
- said unit circuit device comprises a

  plurality of test terminals for a test on said electronic

  circuit arranged on a side not adjacent to said other

  unit circuit devices; and

said test terminals are connected ,

20 respectively to said electronic circuit by interconnection via said input/output interface circuit.

- 7. An integrated circuit device as set forth in claim 5, wherein
- 25 said unit circuit device has a plurality of

test terminals for a test on said electronic circuit
arranged on a side adjacent to said other unit circuit
devices and inside said device connection terminals; and
said test terminals are connected

- respectively to said electronic circuit by interconnection via said input/output interface circuit.
  - 8. An integrated circuit device as set forth in claim 5, wherein
- said external connection terminals serve as connection terminals for connecting with outside the electronic circuit apparatus and also as connection terminals for a test on said electronic circuit.
